

ABSTRACT OF THE DISCLOSURE

A method of an overlay (310) having a surface energy charge for verifying an image (210) on printing plates formed by creating an imaged receiver sheet (140) having an image, a first thermal print layer (224), and a first support layer (150). An imageless receiver sheet (160) has a second thermal print layer (228) and a clear second support layer and laminates with the imaged receiver sheet thereby encapsulating the image. The first support layer is removed.
